Report No. 404
Consumption of Some Important Commodities in India

NSS 50th Round 1993-94

National Sample Survey Organisation
Department Of Statistics
Government Of India

March 1997
PREFACE

The National Sample Survey Organisation (NSSO) has been carrying out all-India surveys quinquennially on consumer expenditure and employment & unemployment. The fifth quinquennial survey on the subject was undertaken in the 50th round of NSS (July 1993 - June 1994). The present report is the fourth in the series of reports through which the results on consumer expenditure survey are being released.

The report contains detailed tables giving estimates of monthly per capita consumer expenditure on more than 90 different items of consumption, along with the estimated proportions of households consuming each item during the last 30 days for rural and urban areas of each State and Union Territory of India. The items include 58 items of food and fuel, 10 items of clothing and footwear, and 6 items of educational & medical expenses.

The report also contains details of consumption pattern of different fractile groups of population for different States formed on the basis of household monthly per capita expenditure (MPCE), and estimates of MPCE built up using a reference period of one year instead of one month for selected commodity groups.

Chapter 1 of the report introduces the subject. Chapter 2 deals with note on the sample design and estimation procedure of the survey. Chapter 3 sets out the relevant concepts and definitions. Chapter 4 discusses per capita expenditure estimates of important items of consumption. Chapter 5 deals with the variation of consumption pattern over fractile groups, and the effect of different reference periods on consumption estimates has been discussed in Chapter 6.

The field work of the survey was done by the Field Operations Division; data processing work was handled, as usual, by the Data Processing Division and the Survey Design and Research Division was responsible for preparing this report. I am thankful to the members of the Governing Council particularly for taking pains to go through the draft report and offer their comments, which proved very helpful in improving the report. I am also thankful to the heads of various Divisions of the NSSO, who got the tasks assigned to their Divisions accomplished very efficiently.

P.R. Dongre

National Sample Survey Organisation
Consumption of atta (wheat flour) by the average rural Indian was 4.13 kg per month in 1993-94. This represents a fall of about 350 gm - more than 10 gm per day - since 1987-88.

Per capita consumption of rice in 1993-94 was 6.8 kg per month in rural India and 5.1 kg per month in urban India.

Consumption of milk per person has risen by about 600-700 ml per month between 1987-88 and 1993-94. In 1993-94 it remained under 4 litres per month in rural areas and under 5 litres per month in urban. Consumption levels in the northern and north-western states were much higher than this. One-third of all rural households and one-fifth of all urban households reported zero consumption of milk during the last 30 days.

Consumption of edible oil per person was 370 gm per month (330 gm in 1987-88) in rural India and 560 gm (540 gm in 1987-88) in urban India. The shares of groundnut oil and mustard oil in total edible oil consumption show a definite increase since 1987-88. Per capita consumption of groundnut oil has increased by as much as 33% in both rural and urban areas.

Consumption of meat per person has remained unchanged since 1987-88 at about 80 gm per month in rural areas and about 140-150 gm per month in urban areas. The average urban Indian consumed less than 2 eggs per month in 1993-94, and the average rural Indian, less than 1.

The percentage of households containing at least one bidi smoker has declined from 47% to 45% for rural areas and from 31% to 27% in urban areas between 1987-88 and 1993-94. The percentage of urban households containing at least one cigarette smoker has declined from 13% to 11% but the rural figure remains unchanged at 4%.

Electricity consumption per person has risen from 1.3 units (kwh) per month to 2.3 units in rural areas and from 7.2 units to 9.7 units in urban areas. The percentage of LPG-using households has risen in urban areas from 18% to 30%.

In rural areas, home produce accounted for 74% of consumption of milk, 38% of consumption of rice, 30% of consumption of eggs, and 44% of consumption of coconuts in 1993-94.

The average urban household in India spent about Rs 20 per person per month (4-4.5% of all consumption expenditure) on each of the three heads - "medical", "education", and "conveyance". Rural households spent Rs 7 (2.5% of overall consumption expenditure) on these three needs.
expenditure) per person on conveyance and only Rs 4 per person on education, but medical expenses formed a larger share (5%) of their consumption expenditure. Rs 13 per person was spent per month on toilet articles in urban areas and Rs 7 in rural areas.

Monthly expenditure on telephone charges (excluding deposit for getting telephone connection) in urban areas, which was less than Rs 0.51 in 1987-88, has exceeded Rs 2 in 1993-94. Per capita household consumer expenditure on petrol (for own vehicle) has increased from about Rs 2.10 to Rs 7.35 per month in urban areas since 1987-88. Per capita expenditure on tuition fees in urban areas has risen from Rs 2.84 per month in 1987-88 to Rs 8.12 in 1993-94.

Cinema/theatre expenditure was reported by only 30% of urban households in 1993-94 compared to 46.5% in 1987-88 - a drop of over 16 percentage points.

Ranking the population of rural India by per capita household consumer expenditure, the average monthly per capita consumer expenditure of the bottom 5% of rural population was Rs 101 and that of the top 5% was Rs 875. For the urban population, average spending per month was Rs 133 person for the bottom 5% and Rs 1626 for the top 5%.

Chapter 1

Introduction

1.0 The fifth quinquennial NSS survey of consumer expenditure and employment was conducted in 1993-94 as the principal enquiry of the 50th "round" of NSS. The household consumer expenditure schedule was canvassed in 115354 households located in 6951 villages and 4650 urban blocks. Through this schedule, data was collected on quantity and value of household consumption of different goods and services, using a reference period of "last 30 days" preceding the date of survey. This report is the fourth of a series of reports through which the findings of the consumer expenditure survey are being released.

1.1 Background: It was originally the practice to collect data on household consumer expenditure in every round of NSS, starting from the very first round (1950-51). From 1972-73, according to a decision of the Governing Council of NSSO, the consumer expenditure survey became a quinquennial feature. It was also integrated with the employment and unemployment survey in the sense that a common sample of households was subjected to both the enquiries. An annual series of smaller-scale consumer expenditure surveys was again launched from the 42nd round (1986-87) to fill the data gaps which planners and researchers had begun to feel. It is the larger-scale quinquennial surveys, however, which are expected to be most useful for the study of trends in the level of consumer expenditure and of the emergence of new spending patterns. The five quinquennial surveys of consumer expenditure have been those of the 27th, 32nd, 38th, 43rd and 50th rounds of NSS. They relate, respectively, to the years 1972-73, 1977-78, 1983, 1987-88 and 1993-94.

1.2 The National Sample Survey was set up in 1950, with the idea of having a permanent survey organisation to collect data on various facets of the economy through nationwide sample surveys in order to assist in socio-economic planning and policy making. The NSS is a continuing survey in the sense that it is carried out in the form of successive "rounds", each round usually of a year's duration covering several topics of current interest in a specific survey period. At present each NSS round reaches, at the all-India level, about 12,000 to 14,000 villages and blocks in the Central sample (covered by the Central agency NSSO) and an independent sample of about 14,000 to 16,000 villages and blocks in the State sample (covered by the Governments of various states and union territories). The entire area of the country - rural and urban - is covered, with the exception of some interior areas of Nagaland and Andaman & Nicobar Islands, and Ladakh and Kargil districts of Jammu & Kashmir. In the 50th round, certain other districts of Jammu & Kashmir, viz. Doda, Anantnag, Pulwama, Srinagar, Badgam, Baramula and Kupwara, and Punjab's Amritsar district, had to be excluded from the survey due to unfavourable field conditions.

1.3 The household consumer expenditure schedule used for the survey collected information on quantity and value of household consumption with a reference period of last 30 days preceding the
date of interview. To minimise recall errors, a very detailed item classification was, as usual, adopted to collect information, including 190 items of food, 25 items of clothing and footwear, 20 items of educational and medical expenses, 66 items of durable goods, and about 111 other items. For items of clothing, footwear, and durable goods, on which consumption expenditure by individual households varies widely from month to month, data with a reference period of "last 365 days" was also collected. The indicator of overall living standards of the household called MPCE (monthly per capita expenditure) was built up using "last 30 days" data for all goods and services. The schedule also collected some other household particulars including age, sex and educational level of each household member.

1.4 The first main report (NSS report no.402) on consumer expenditure based on the 50th round survey released information on (a) distribution of households and persons over MPCE classes for each state/u.t. and all-India (b) averages (state/u.t. and all-India) of MPCE (c) break-up of these average values by important heads of consumption (d) break-ups of both quantity and value of per capita consumption of cereals and pulses by cereal/pulse type. All average values were provided not only for the population as a whole but for 12 different segments of population demarcated by MPCE level.

1.5 In report no.402, consumption expenditure break-up by 20 broad groups of items of consumption were given, the groups being: cereals; gram; cereal substitutes; pulses and pulse products; milk and milk products; edible oil; meat, fish and egg; vegetables; fruits(fresh); fruits(dry); sugar; salt; spices; beverages and processed food; pan, tobacco & intoxicants; fuel & light; clothing; footwear; miscellaneous goods & services; and durable goods.

1.6 Contents of the present report: In the present report an attempt has been made to study consumption patterns in greater detail, using the item classification adopted in the household consumer expenditure schedule. Per capita expenditure estimates are presented here (Chapter 4) for more than 90 different items of consumption, along with the estimated proportions of households consuming each item during the last 30 days. These include 61 items of food (including pan, tobacco, etc.) and fuel, 10 items of clothing and footwear, 6 items of educational and medical expenses, and 14 items of other miscellaneous expenditure. For food, fuel, clothing and footwear, estimates of per capita quantity of consumption are also provided. For these detail items estimates are not, however, generated separately for different MPCE classes of the population as such estimates would be subject to much wider margins of sampling error.

1.7 The MPCE classes used in tabulation of 50th round consumption data (see NSS report no. 402) correspond to fractile groups of the all-India population; for instance, the lowest MPCE class represents the range of MPCE in which the bottom 5% (ranked by MPCE) of the Indian population is estimated to lie. The all-India tables may therefore be used to provide ready answers to questions such as “What is the average cereal consumption of the poorest 5% of the rural population of India?” However, if one substitutes “Haryana” or “Bihar” for “India” the question becomes more difficult to answer, because the fractiles of the MPCE distribution of, say, Haryana, are not the same as those of the all-India distribution. Thus the lowest MPCE class Rs. 0-120 which is estimated to contain the poorest 5% of the rural population of India, contains only 1.1% of the population of rural
Haryana, and as much as 8.1% of the population of rural Bihar (NSS report nos. 401,402). The problem is solved through tables showing composition of per capita expenditure for specific fractile groups of population of each state/u.t. - these can be used to study consumption patterns of various segments of the population of any state/u.t. such as the top 10%, the middle 40%, and so on, and also to make inter-state comparisons of corresponding segments. This has been done in Chapter 5.

1.8 An attempt has also been made (Chapter 6) to investigate the effect of using a reference period of 365 days instead of 30 days on estimates of consumption of clothing, footwear, educational and medical goods and services, and durable goods. The impact on the distribution of MPCE of using the “365 days” reference period for these goods and services in building up the household MPCE figure has also been explored. Apart from this, the "last 30 days" reference period has been used throughout the report, as in the earlier reports, for all goods and services.

1.9 Detailed tables at the national level are provided in Appendix A and tables at state/u.t. level in Appendix B.
Chapter 2

Sample design

2.0 Sample Design: A stratified two-stage sampling design was adopted, with census villages as first stage units (fsu's) in the rural sector and Urban Frame Survey (UFS) blocks in the urban, except for a few newly declared towns of the 1991 census, for which UFS frames were not available, and census enumeration blocks (EB's) were used as first stage units. Households formed the second stage units in both rural and urban sectors.

2.1 The survey period of one year was divided into four sub-rounds of three months each and equal numbers of sample villages and blocks allotted to each sub-round.

2.2 Sampling frame for fsu's: In the rural sector, the sampling frame was provided sometimes by the 1981 census list of villages and sometimes by the 1991 census list of villages, depending on the sub-round (see para 2.1) and the state/union territory being surveyed, as follows.

2.2.1 In the following areas of rural India (hereafter referred to as Group A areas), the 1981 census lists of villages served as the sampling frame for all 4 sub-rounds:

- Jammu & Kashmir - where the 1991 census was not conducted.
- Agra district of U.P. and Durg, Sagar and Morena districts of M.P. - for which the available information for 1991 was incomplete.

2.2.2 In the following areas of rural India (hereafter referred to as Group B areas), the 1991 census lists of villages served as the sampling frame for all 4 sub-rounds:

- Andhra Pradesh, Assam, Kerala, Orissa, W.Bengal & Chandigarh.
- U.P. and M.P. (excluding Group A areas).

2.2.3 In the remaining states/u.t.'s of rural India (hereafter referred to as Group C areas), the 1981 census lists of villages were used as sampling frame for sub-round 1 and the 1991 census lists used for sub-rounds 2 to 4 in order to make use of the latest available information in the sample selection process.
2.2.4 For Nagaland, the villages situated within 5 km of a bus route constituted the sampling frame. For the Andaman & Nicobar Islands, the villages which remain inaccessible throughout the year were, as usual, excluded from the sampling frame.

2.2.5 In the urban sector, the lists of NSS Urban Frame Survey (UFS) blocks were the sampling frames used in most cases. However, 1991 census house listing enumeration blocks were considered as the sampling units for some of the newly declared towns of the 1991 population census, for which UFS frames were not available.

2.3 **Stratification**: As usual, each state/union territory (u.t.) was divided into one or more agro-economic regions by grouping contiguous districts which are similar with respect to population density and crop pattern. In Gujarat, however, some districts were sub-divided for the purpose of region formation on the basis of location of dry areas and the distribution of tribal population in the state. The total number of regions formed in the whole of India was 78.

2.3.1 In the rural sector, within each region, each district normally formed a separate stratum. However, if the census population of the district according to the sampling frame used exceeded 1.8 million / 2 million (depending on whether 1981 or 1991 census frame was used), the district was split into two or more strata by grouping contiguous tehsils. In Gujarat, however, in the case of districts extending over more than one region, the portion of a district falling in each region constituted a separate stratum even if the rural population of the district as a whole was less than 1.8 million / 2 million.

2.3.2 In the urban sector, strata were formed, again within NSS regions, on the basis of town population. In order to be able to allocate a larger proportion of the sample to the affluent section of society and thus improve the precision of the overall estimate of consumer expenditure, the usual first-stage stratification procedure was modified as follows. Urban blocks in towns with census population 400,000 or more were placed in different strata depending on whether they belonged to the "affluent" area of the town or not - the information on affluent areas being supplied by the regional/sub-regional field offices of NSSO. Full details of urban stratification are given below.

2.4 Following usual NSS practice, the sample of villages and blocks in which the enquiry was carried out was drawn in the form of two independent sub-samples. Either of these sub-samples could be used to generate a valid set of estimates which might be regarded as the provisional results of the survey until such time as the final results, based on the entire sample, were available.

2.5 Allocation of sample: The first-stage sample size for any state/union territory of India was determined on the basis of its investigator strength and the expected workload per investigator. This sample was first allotted to the rural and urban sectors in consideration of the relative sizes of the rural and urban population with double weightage to the urban sector.

2.5.1 Within the urban sector of a state/u.t., allocation of the sample to the different urban strata was done in proportion to stratum population with double weightage to affluent strata - that is, strata 4, 6 & 8 (see para 2.3.2). Stratum level allocations were adjusted to multiples of 8 as far as possible so as to have equal allocations for each sub-sample-sub-round combination.

2.5.2 Within the rural sector of a state/u.t., allocation of the sample to the different rural strata was done as follows.

2.5.3 For Group B areas (see para 2.2), the state/u.t. level rural sample was allocated to the different rural strata in proportion to 1991 census population. For other areas (Group A and Group C), allocation was initially made on the basis of 1981 census population. Stratum level allocations were adjusted to multiples of 8 as far as possible so as to have equal allocations for each sub-sample-sub-round combination.

2.5.4 However, for Group C areas, the original allocations for sub-rounds 2 to 4 were revised as follows. The total state/u.t. level allocation for sub-rounds 2 to 4 combined - 75% of the total as 25% had gone to sub-round 1 - was re-allocated to the rural strata in proportion to stratum population as per 1991 census. Stratum level allocations were adjusted to multiples of 6 as far as possible so as to have equal allocations for the remaining sub-sample-sub-round combinations.

2.6 Selection of fsu's: Sample villages - except in Arunachal Pradesh - were selected by PPS circular systematic sampling (with population as the size variable) from the appropriate sampling frame as explained in para 2.2, in the form of two independent sub-samples. Sample blocks were selected by ordinary (equal probability) circular systematic sampling, also in the form of two independent sub-samples.

2.6.1 In Arunachal Pradesh the sample of villages was drawn by a cluster sampling procedure. The field staff were supplied with a list of sample "nucleus" villages and were advised to select clusters of villages - building up each cluster around a nucleus village - according to prescribed guidelines. The nucleus villages were selected circular systematically with equal probability, in the form of two independent sub-samples.
2.7 **Selection of hamlet-groups/sub-blocks**: To reduce workload the following procedure was adopted in drawing up the second-stage sampling frame. Larger sample villages and blocks were divided - according to usual NSS practice - into a suitable number of "hamlet-groups"/"sub-blocks" of roughly equal population content: the second-stage sampling frame was constituted of the households belonging to only two of these hamlet-groups, selected circular systematically, in case of sample villages, and one randomly selected sub-block in case of sample blocks (instead of the whole village/block). No hamlet-group formation was, however, done in Arunachal Pradesh. In Kerala, practical difficulties arose in hamlet-group formation during sub-round 1. These were resolved by selecting, instead of two hamlet-groups, two EB's from the constituent EB's of large villages.

2.8 **Selection of households**: The affluent classes of society have expenditure levels spread over a very wide section of the consumer expenditure range. As a result, the contribution of these classes to the sampling error of a consumer expenditure survey is large compared to that of an equal-sized chunk of population belonging to the more homogeneous "middle classes" (say). To improve the efficiency of consumer expenditure estimates, it was decided that the second-stage sampling frames ought to be stratified in such a way as to be able to allocate a larger proportion of the sample to the affluent sections of the population wherever they could be located.

2.8.1 **Rural**: In sample villages, households in the second-stage sampling frame were divided into two strata as follows. Households - if any - exhibiting signs of affluence such as the possession of any of a specified list of assets including land in excess of a certain specified area, or a member holding a good salaried job or belonging to a paying profession such as that of a doctor or advocate, were designated "affluent households" and the top 10 such households (subject to availability) placed in stratum 1. The remaining households formed second-stage stratum 2. Two households were selected circular systematically from second-stage stratum 1. From second-stage stratum 2, eight households were selected circular systematically after arranging the households in the stratum by "means of livelihood"; this meant that households "self-employed in agriculture" were placed first, followed by "rural labour" households, and then the "others". Further, the households under "others" were arranged in five different land-possessed classes to ensure spread of the sample over households of different economic statuses.

2.8.2 **Urban**: In sample blocks, households with monthly per capita consumer expenditure (as reported at the time of household listing) Rs. 1200 or more (Rs. 1500 or more in towns with population one million and above) were placed in second-stage stratum 1 and the rest in second-stage stratum 2. In sample blocks belonging to first-stage strata 4, 6 & 8 (affluent areas of towns with population 4 lakhs or more), as many as four sample households were selected for survey from second-stage stratum 1 and six from second-stage stratum 2. In all strata other than those numbered 4, 6 & 8, two sample households were selected from second-stage stratum 1 and eight from second-stage stratum 2. In each case the sample of households, for each second-stage stratum, was drawn circular systematically with a random start. The households in second-stage stratum 2 were, prior to sample selection, placed in eight different groups and the different groups of households placed one after another in a specified order to ensure spread of the sample over the
different groups. The grouping was done on considerations of means of livelihood (self-employed / regular wage or salary earning / casual labour / others) and household monthly per capita consumer expenditure.

2.9 **Sample size** : The survey covered, in all, 115354 households spread over 11601 sample villages/blocks. The number of sample villages and blocks allotted and surveyed, and the number of sample households and persons surveyed, are given for different state/u.t.'s and all-India in Table T0, separately for rural and urban sectors.

\[ \bar{y} = \sum_{s} \frac{1}{n_s} \sum_{i} P_{si} D_{si} \sum_{t=1}^{2} \sum_{j=1}^{h_s} H_{sit} \sum_{j=1}^{h_s} y_{sij} \]

2.10 **Estimation Procedure**

\[ \bar{y} = \sum_{s} \frac{1}{n_s} \sum_{i} \sum_{s} N_{si} \sum_{t=1}^{2} \sum_{j=1}^{h_s} H_{sit} \sum_{j=1}^{h_s} y_{sij} \]

2.10.1 **Estimation of aggregates at sub-sample level** : Aggregates are first estimated at sub-sample level according to the following estimation formulae, where \( \bar{y} \) denotes the estimate - based on one sub-sample - of the aggregate of a given characteristic \( Y \) for a sector of a state/u.t.

For the rural sector of a state/u.t. other than Arunachal Pradesh,

For the rural sector of Arunachal Pradesh,

For the urban sector of a state/u.t.,

where

- \( y \) : observed value of the same characteristic in a sample household
- \( s \) : stratum suffix
- \( t \) : second-stage stratum suffix
- \( i \) : sample village/block suffix
- \( j \) : sample household suffix
- \( D \) : number of hamlet-groups/sub-blocks formed in the surveyed village/block
- \( H \) : number of households listed in the second-stage sampling frame
- \( h \) : number of sample households surveyed
\[ R^2 = \frac{\bar{Y}}{\bar{X}} \]

2.10.2 **Estimation of aggregates for the combined sample (pooling sub-samples)**: The combined sample estimate of an aggregate is obtained as the simple average of the corresponding sub-sample estimates.

2.10.3 **Estimates of ratios**: The estimate of a ratio of the form \( R = Y/X \), where \( Y \) and \( X \) are the population aggregates of two characters, is obtained as

where \( \bar{Y} \) and \( \bar{X} \) are estimates of \( Y \) and \( X \) obtained according to the procedure laid down in paras 2.10.1 and 2.10.2. Examples of ratio estimates are rates and percentages.

Chapter 3

Concepts and Definitions

3.1 Household: A group of persons normally living together and taking food from a common kitchen constitutes a household. The word "normally" means that temporary visitors are excluded but temporary stay-aways are included. Thus a son or daughter residing in a hostel for studies is excluded from the household of his/her parents, but a resident employee or resident domestic servant or paying guest (but not just a tenant in the house) is included in the employer/host's household. "Living together" is usually given more importance than "sharing food from a common kitchen" in drawing the boundaries of a household in case the two criteria are in conflict; however, in the special case of a person taking food with his family but sleeping elsewhere (say in a shop or a different house) due to space shortage, the household formed by such a person's family members is taken to include the person also. Each inmate of a mess, hotel, boarding and lodging house, hostel, etc. is considered as a single-member household except that a family living in a hotel (say) is considered as one household only; the same applies to residential staff of such establishments.

3.2 Household consumer expenditure: The expenditure incurred by a household on domestic consumption during the reference period is the household's consumer expenditure. The household consumer expenditure is the total of the monetary values of consumption of various groups of items namely (i) food, pan (betel leaves), tobacco, intoxicants and fuel & light, (ii) clothing and footwear and (iii) miscellaneous goods and services and durable articles.

3.2.1 For groups (i) and (ii), the total value of consumption is derived by aggregating the monetary value of goods actually consumed during the reference period. An item of clothing and footwear would be considered to have been consumed if it is brought into maiden or first use during the reference period. The consumption may be out of (a) purchases made during the reference period or earlier; (b) home grown stock; (c) receipt in exchange of goods and services; (d) any other receipt like gift, charity, borrowing and (e) free collection. Home produce is evaluated at the ex farm or ex factory rate. For evaluating the consumption of the items of group (iii) i.e. items categorised as miscellaneous goods and services and durable articles, a different approach is followed. In this case, the expenditure made during the reference period for the purchase of goods and services is considered as consumption.

3.2.2 It is pertinent to mention here that the consumer expenditure of a household on food items relates to the actual consumption by the normal resident members of the household and also by the guests whether during ceremonies or otherwise. To avoid double counting, transfer payments like
charity, loan advance, etc. made by the household are not considered as consumption for items of groups (i) and (ii), since transfer receipts of these items have been taken into account. However, the item "cooked meals" is an exception to the rule. Meals prepared in the household kitchen and provided to the employees and/or others would automatically get included in domestic consumption of employer (payer) household. There is a practical difficulty of estimating the quantities and values of individual items used for preparing the meals served to employees or to others. Thus, to avoid double counting, cooked meals received as perquisites from employer household or as gift or charity are not recorded in the recipient household. As a general principle, cooked meals purchased from the market for consumption of the normal resident members and for guests and employees will also be recorded in the purchaser household.

3.2.3 This procedure of recording cooked meals served to others in the expenditure of the serving households only leads to bias-free estimates of average per capita consumption as well as total consumer expenditure. However, as the proportions of donors and recipients of free cooked meals are likely to vary in opposite directions over the expenditure classes, the nutritional intake derived from the consumer expenditure survey data may present a somewhat distorted picture. These derived nutrition intakes may get inflated for the rich (net donors) and somewhat understated for the poor (net recipients). This point has to be kept firmly in mind while using the NSS consumer expenditure data for any nutritional studies relating to the nutritional status of households.

3.3 **Value of consumption**: Consumption out of purchase is evaluated at the purchase price. Consumption out of home produce is evaluated at ex farm or ex factory rate. Value of consumption out of gifts, loans, free collection, and goods received in exchange of goods and services is imputed at the rate of average local retail prices prevailing during the reference period.

3.4 **Cash purchase**: The term cash purchase is used to signify that purchases for which payment is made in kind (barter purchase) are excluded. Credit purchases (where payment is to be in cash) are included even when payment is not made within the reference period. Only purchases made for domestic consumption are considered.

3.5 **Consumption out of home-grown or home-produced stock**: Home-produced or home-grown stock refers to goods produced by households in their own farm or manufacturing establishment and crop received as rent on land leased out. Produce brought from village home and consumed at urban residence is also included. Valuation excludes transport charges for carrying the commodity to the place of residence for consumption.

3.6 **Reference period**: Consumption data appearing in this report were all collected with a reference period of “last 30 days”, i.e. the 30 days immediately preceding the date of survey. The reference period used for the survey, in other words, was a “moving” one, varying from household to household.

3.7 **Sector**: A word used for the rural-urban demarcation: rural and urban are the only two sectors as far as this report is concerned.
3.8 **Major states**: This refers to the following states of India: Andhra Pradesh, Assam, Bihar, Gujarat, Haryana, Karnataka, Kerala, Madhya Pradesh, Maharashtra, Orissa, Punjab, Rajasthan, Tamil Nadu, Uttar Pradesh and West Bengal.

3.9 **Household size**: The size of a household is the total number of persons in the household.

3.10 **Adult**: A person who has completed 15 years of age.

3.11 **Monthly per capita expenditure (MPCE)**: For a household, this is household consumer expenditure over a period of 30 days divided by household size. A person's MPCE is understood as that of the household to which he/she belongs.

3.12 **MPCE classes**: It is the usual practice, in NSS consumer expenditure reports, to present various estimates, including state and all-India level values of different socio-economic indicators, and distributions of households and persons over different socio-economic categories or statuses, separately for a number of classes of the population formed on the basis of MPCE. For the 50th round, 12 MPCE classes were drawn up for each sector - rural and urban - as follows. For the rural (urban) sector, the class limits were so chosen that each class, excepting the top two classes and the bottom two, approximately contained an estimated 10% of the rural (urban) population, while the remaining four classes each contained an estimated 5% of the population. Some adjustments were, however, made to keep some common class limits for the rural and urban sectors. Tabulation of results by MPCE class from the 43rd to the 49th round of NSS, incidentally, was done using MPCE classes derived in a similar way, using 43rd round MPCE data. In other words, the MPCE classification is being updated for the first time since the 43rd round. The classification used here is:

<table>

</tr>
<tr>
<td>11. 455 - 560</td>
<td>825 - 1055</td>
</tr>
</tbody>
</table>
3.13 **Groups of consumption items**: Results on break-up of MPCE over different items of consumption are presented for 20 broad item groups in Table 8. These are (1) cereals (2) gram (3) cereal substitutes (4) pulses & pulse products (5) milk and milk products (6) edible oil (7) meat, fish & egg (8) vegetables (9) fruit (fresh) (10) fruit (dry) (11) sugar (12) salt (13) spices (14) beverages, refreshments & processed food (15) pan, tobacco & intoxicants (16) fuel & light (17) clothing (18) footwear (19) miscellaneous goods and services (20) durable goods. Apart from these, sub-totals of MPCE on (a) food and (b) non-food are also provided.

3.14 **Miscellaneous goods and services**: This includes amusement, goods for personal care and effect, toilet articles, consumer services, conveyance etc. In fact, this is a residual group containing items other than food, pan, tobacco, intoxicants, fuel and light, clothing, footwear and durable goods.

3.15 **Amusement**: This includes expenses on cinema, theatre, fairs, etc., photography, sports goods, toys, club fees and other recreational/hobby expenses, and hire charges for video cassettes/VCR/VCP.

3.16 **Goods for personal care**: These include pens, torches, locks, spectacles, umbrellas and raincoats, walking sticks, sanitary napkins and cigarette lighters.

3.17 **Sundry articles**: These include electric bulbs, fluorescent tubes, batteries other non-durable electrical goods, earthenware, glassware, plastic goods, washing requisites, flowers, incense, insecticide and other petty household articles.

3.18 **Consumer services**: This category includes expenses on domestic servants, cook, sweeper, barber/beautician, laundry and ironing, tailor, priest, and pet animals; legal expenses, postage, telegram and telephone charges, repair charges (excluding repairs of household durables), grinding charges, and other consumer services excluding transport.

3.19 **Conveyance**: Apart from bus, rail, plane, steamer, taxi and similar fare, this includes cost of fuel for owned motor transport and animal feed for owned animal driven carriage, but not driver's or cleaner's salary, nor garage rent. Expenses of holiday transport reimbursed by employer (e.g. Leave Travel Concession journeys by Government servants) are included.

3.20 **Rent**: This includes house rent (residential building), garage rent, residential land rent, and consumer rent (other goods). For government accommodation, the portion of monthly emoluments forfeited on account of occupation of government quarters is considered as monthly house rent payment. Hire charges of video cassettes, VCR and VCP are not accounted in consumer rent here but under “amusement”.
3.21 **Taxes**: This category includes road cess, chowkidari tax, municipal rates, other taxes and cesses paid by the household as a domestic consumer, and consumer license fees. It does not include income tax or sales taxes.

3.22 **Institutional medical expenses**: Here the term "institutional" indicates that the expenses were incurred as in-patient of a hospital, nursing home, or other medical institution.

3.23 **Durable goods**: This term refers to durable goods other than clothing and footwear; items included here are distinguished from miscellaneous goods by having a longer expected lifetime of use (roughly, one year or more). Expenditure incurred on repairs and construction of durables used for domestic purpose is included in "expenditure on durable goods".

3.24 **Adjusted MPCE**: For some categories of items - viz. clothing, footwear, education, medical (institutional) and durable goods - household consumption data were collected in the survey for two reference periods: "last 30 days" and "last 365 days" preceding the date of survey. Clearly, there are two possible methods of calculation of monthly per capita consumer expenditure of a sample household - one using "last 365 days" data for clothing, footwear, education, medical (institutional) and durable goods, and 30 days’ data for other items - and the other using 30 days’ data for all items uniformly. The latter is the usual MPCE figure used in presenting the survey results. The former method - making use of 365 days’ data where available - leads to a different value of MPCE which has been called "adjusted MPCE" in this report.

3.25 **Fractile groups**: These refer to segments of the population ranked by MPCE. The fractile group "0-5" means the poorest 5% of the population in terms of MPCE, the “5-10” group, the next 5%, the "10-20" group, the next 10%, and so on, up to "95-100", which refers to the top 5% of the population in terms of MPCE.

3.26 **Notes on coverage of specific items**

3.26.1 **Rice**: This does not include rice products such as *chira* (rice flakes), *muri* (puffed rice), etc. This is a departure from the convention normally followed in presenting NSS tables of cereal consumption estimates (see, e.g., NSS report nos.401, 402) where rice stands for "rice and rice products", "wheat" for "wheat and wheat products", and so on. Cooked rice purchased from market is not accounted here.

3.26.2 **Atta**: The "purchase" figures exclude wheat purchased and converted into *atta* by the household.

3.26.3 **Milk (liquid)**: Consumption of "milk (liquid)" includes milk converted into curds, butter, *ghee*, casein (*panir*), etc. within the household prior to consumption. It also includes milk going into household preparation of sweetmeats. Bottled or polypacked flavoured milk comes under milk (liquid).
3.26.4 **Ghee**: Consumption of ghee excludes ghee prepared from milk within the household. See milk (liquid).

3.26.5 **Mustard oil, coconut oil, etc**: Oil used for toilet purposes is not accounted here.

3.24.6 **Sugar**: Consumption of sugar includes sugar used in household preparation of sweetmeats, pickles etc.

3.26.7 **Biscuits, salted refreshments, prepared sweets, dung cake**: Information on quantity purchased/consumed of these items was not collected in the 50th round survey.

3.26.8 **LPG**: Expenditure on this does not include caution money deposited for getting a cylinder connection.

3.26.9 **Clothing**: Apart from clothing proper, this category includes bedsheets, bedcovers, pillows, curtains, mattresses, blankets, rugs, mats and mattings, cotton yarn, wool, and knitting wool. It, however, excludes tailoring charges, which come under "miscellaneous goods and services".

3.26.10 **Saree**: This includes variants such as "mekhla" (Assam), and “dakbanda” (Garo hills).

3.26.11 **Education**: Cost of all books including fiction and journals and all newspapers and magazines bought by the household are included under "education". All tuition fees (but not school donations) are included. School bus/van expenses are excluded.

3.26.12 **Medical**: Expenditure on family planning appliances is included here. Free medicines and medical treatment received from employer are excluded. But expenditure on medicine, medical tests, and treatment incurred by the household and reimbursed by the employer are included.
Chapter 4

Per capita consumption of individual items:

for states, union territories and the country

4.0.1 As mentioned in Chapter 1, the NSS 50th round results released prior to this report use an item classification with 20 broad item groups to describe the pattern of consumer expenditure in India and its states and Union Territories. The 20 groups include 14 food groups and 6 non-food groups. The present report makes use of the detailed item classification adopted in the schedule of enquiry to study consumer expenditure patterns in much greater detail. In this chapter, per capita expenditure estimates are presented for more than 90 different items of consumption, including 61 items of food, tobacco and fuel, 10 items of clothing and footwear, 6 items of educational and medical expenses, and 14 items of other miscellaneous expenditure. These estimates are given for rural and urban areas of all 32 states and u.t.’s of India (but not separately for different MPCE classes).

4.0.2 The detailed tables in the Appendix have numbers which are the same for different states and u.t.’s: e.g., Table 1 gives food and fuel estimates for India and all its states and u.t.’s. However, the tables are arranged so that all the national tables appear at the beginning as Appendix A, followed by the state tables (Appendix B).

1. FOOD AND FUEL

4.1.1 Table 1 (all-India: Appendix A; states & u.t.’s: Appendix B) gives quantity and value of per capita purchase and consumption, over a 30-day period, of 51 items of food, 6 items of fuel, and *pan, bidis* and cigarettes. The all-India estimates are followed by the all-India figures based on the 43rd round (July 1987-June 1988).
4.1.2 Table 1 also shows quantity and value of per capita consumption out of home-produced stock of each item. For each item, the number of sample households reporting consumption is given in column 10, and the estimated proportion (no. per 1000) of consuming households (in a 30-day period), in column 9.

4.1.3 Cereals and pulses. The earlier NSS reports (nos.400, 402) have dwelt on trends in per capita cereal consumption over the period between the 43rd and 49th/50th rounds. In these reports cereals were sub-divided into "rice and rice products", "wheat and wheat products", "jowar and jowar products", and so on. It was observed that per capita cereal consumption has registered an overall decline of about 1 kg per month in rural India and about 600 gm per month in urban India between the 43rd and 50th rounds of NSS (see Table T2). The detailed item level tabulations (Table T1) show that all-India consumption of atta has undergone a definite decline (of about 300-400 gm per month) in rural areas since 1987-88, but the decline in urban areas seems

*unless otherwise specified

#excludes those reporting consumption out of purchases from public distribution system only
negligible. In the urban sector, per capita consumption of rice has declined more (over 100 gm per month) than that of atta. While per capita consumption of pulses has remained stable in rural areas, a marginal decline in consumption of most varieties appears to be indicated in the urban sector.

4.1.4 Milk (liquid). This term (see para 3.24.3) includes milk products such as curds and ghee (but not milk-based sweetmeats) prepared from milk within the household. Per capita consumption per month has increased since 1987-88 by about 600-700 ml in both sectors, but it was under 4 litres (about 130 ml per day) in rural areas and under 5 litres (about 165 ml per day) in urban areas. One-third of rural households and one-fifth of all urban households reported no consumption of milk during the last 30 days; these proportions have not changed greatly since the 43rd round. The state/u.t. level estimates, however, show considerable regional variation in milk consumption in the country; consumption level is much higher in the northern and north-western states (Punjab, Haryana, Himachal Pradesh, Jammu & Kashmir, Rajasthan) than in the rest of the country.

4.1.5 Edible oil. All-India estimates of per capita consumption of edible oil (not shown in Table 1) are slightly higher for the 50th round than for the 43rd round (Table T3). Figure 1 indicates that the “national” pattern of consumption of edible oil is undergoing certain changes. The shares of groundnut oil and mustard oil in total edible oil consumption show a definite increase. Per capita consumption of groundnut oil appears to have increased by as much as 33% between 1987-88 and 1993-94 in both rural and urban areas. Mustard oil remains more popular than groundnut oil in rural India, where its consumption has increased faster over this period than in urban areas. Per capita consumption of vanaspati has declined in both rural and urban areas since 1987-88.

4.1.6 Meat, eggs and fish. There is a great deal of regional variation in the consumption of these items. At the all-India level, consumption of meat is almost wholly accounted by the contribution of the three categories: goat meat, mutton, and chicken. This has remained unchanged at about 80 gm per person per month in the rural sector and about 140-150 gm in the urban. Judging by percentages of households reporting consumption of different meats, there has been a slight shift in urban consumption habits away from goat meat and towards chicken. Per
capita consumption of eggs remains under 1.5 eggs per person per month in the urban sector; even this figure is more than twice the figure for the rural sector. Both rural and urban areas show some increase in per capita consumption of fish.

4.1.7 **Vegetables.** Per capita consumption of onions, cabbages and tomatoes was higher during 1993-94 in both rural and urban areas than during the 43rd round, with tomatoes registering the most significant increase (rural: over 80%; urban: nearly 50%). On the whole, per capita consumption levels of vegetables appear to have risen slightly, and so have percentages of households reporting their consumption.

4.1.8 **Fruits and nuts.** It was noted in the earlier report (NSS report no.402) that the food group “fruits and nuts” showed a marked rural-urban differential in the incidence of consumption as measured by percentages of households reporting consumption “last month”. Among individual items, the rural-urban differential in this percentage (see Table T4) is now seen to be as high as 25 percentage points for bananas, 17 for apples, and 4-6 points for groundnuts, mangoes, and coconuts. Percentages of households reporting consumption have increased since the 43rd round.

for bananas and apples, and remained stable, or fallen slightly, for coconuts and mangoes. It may be noted that bananas and coconuts accounted for one-half of the value of consumption of fresh fruits by rural households in 1993-94.

4.1.9 **Other food: sugar.** While the all-India consumption of crystalline sugar shows an increase of nearly 100 gm per month in the rural sector, it is offset by an even sharper fall in per capita rural consumption of *gur*, so that the sugar group as a whole registers little change since the 43rd round. Some substitution of sugar for *gur* appears to have taken place in the urban sector as well.
4.1.10 Beverages: tea. While the percentage of households reporting consumption of purchased tea (“tea: no.of cups”) has remained stable since 1987-88, the percentage reporting tea brewed at home (“tea:leaf”) has gone up by about 6-7 percentage points. Less than a third of all rural households and little more than a fifth of all urban households reported no brewing of tea at home during the last 30 days. Only about 7 percent of the rural households and 13 percent of urban households reported consumption of coffee powder or brewing of coffee at home. The percentages were almost the same in 1987-88 as well.

4.1.11 Pan, bidis and cigarettes. Consumption of finished pan has declined since the 43rd round noticeably in the urban sector but not in rural areas. In both sectors, smoking of bidis and cigarettes has gone down, judging by per capita consumption levels. The percentage of households containing at least one bidi smoker has declined from 47% to 45% for rural areas and from 31% to 27% for urban areas. The percentage of urban households containing one or more cigarette smokers also appears to have declined, but the corresponding figure for rural households has remained unchanged at 4 percent.

4.1.12 Fuel and light. Firewood consumption per month has fallen in urban areas by more than 1 kg per capita and the percentage of firewood-consuming households has fallen from 45% to 37%. Electricity consumption per person has risen from 1.3 standard units (kwh) to 2.3 units per month in rural areas and from 7.2 units to 9.7 units in urban areas. Compared to 1987-88, an additional 11-13% of households have become consumers of electricity. Finally, the percentage of urban households in the ranks of LPG consumers has risen by 12 percentage points between 1987-88 and 1993-94 to 30 percent.

4.1.13 Consumption out of home-grown stock. In urban areas this is a negligible phenomenon for most food items. Important exceptions are coconuts, more than 20% of whose urban consumption is seen, at the all-India level, to come from home-grown stock, and milk (over 11% home-produced). About 11% of firewood and chips, and more than one-third of the dung cake, used in urban areas is also reported to be home-produced. For the rural sector, where the home-produced component of consumption is of much greater significance, the percentage share of this component is shown for some important items in Table T6. It is seen that three-quarters of milk consumption in rural areas, and 30% of consumption of eggs, is out of home-produced stock.
Table 1 also shows that about one-fourth to one-sixth of the amount of important pulses consumed in rural areas is home-grown. For firewood and chips, where purchases account for less than 13% of rural consumption, about 54% of consumption in rural India seems to be from “free collection”.

4.1.14 **Value of consumption.** Value of per capita consumption of food as a whole rose by about 76% in the rural sector and about 78% in the urban sector between the 43rd and 50th rounds (NSS report nos. 372, 402). A large part of these changes reflects the rise in the prices of different items of consumption. Table 1 shows that value of per capita rice consumption rose by around 75% in both sectors. For *atta*, the increase was only 64% in rural areas as against 78% in urban areas, the difference being mainly due to the fall in per capita quantity of the cereal consumed by the rural population. The increase for most varieties of pulses was about 70-80%, *arhar dal* (56%) being an exception. Value of per capita milk consumed during 1993-94 was roughly double that in 1987-88 in both sectors. Per capita expenditure on groundnut oil was more than 90% higher, a part of this being due to the 33% increase in quantity of per capita consumption noted above. For mustard oil, the increase in per capita expenditure was 62% in rural areas and 46% in urban areas. Increase in the value of all-India per capita consumption of different vegetables ranged between 55% and 90% in the urban sector but frequently exceeded 100% in the rural, where the rate of increase was almost invariably higher. For sugar, the rise in per capita rural consumption is reflected in the faster growth of per capita expenditure on this commodity in the rural sector.

2. **CLOTHING AND FOOTWEAR**

4.2.1 Table 2 shows the quantity and value of cash purchase, consumption out of home-produced stock, and total consumption per person of 7 categories of clothing over a period of 30 days for the country as a whole (Appendix A) and for different states and u.t.’s in (Appendix B). Appendix A also gives all-India figures (except for quantity estimates) for the 43rd round (1987-88). Number of households per 1000 reporting consumption is shown for each category of clothing. It may be recalled that an item of clothing (or footwear) is considered to be consumed when it is put into first use, and that consumption of second-hand purchases is outside the purview of the NSS schedule of household consumer expenditure. Though clothing and footwear data in the quinquennial NSS surveys on consumer expenditure are collected with two different reference periods - last 30 days and last 365 days - the estimates shown in Table 2 (clothing) and Table 3 (footwear) are based only on "last 30 days" data.

4.2.2 The data show that in both rural and urban areas, percentage of households reporting consumption of clothing articles during the last 30 days has gone down since 1987-88 for all
categories of articles except "ready-made garments", which shows a slight increase. Some degree of substitution of ready-made garments for the more traditional dhotis, sarees and tailor-made clothing is also indicated.

4.2.3 Estimates of value of expenditure on clothing released earlier (see NSS report nos.401, 402) showed per capita expenditure on all clothing to be Rs.15 in rural India and Rs.21 in urban India. The all-India figures in Table 2 show the disparity to be due to price and/or quality differences and not to higher per capita consumption levels in urban areas. Per capita quantity of consumption of dhotis and sarees (in metres) is higher in rural areas than in urban areas. The urban level of per capita consumption exceeds the rural level only for ready-made garments, among the categories considered here.

4.2.4 Table 3, which relates to footwear, gives quantity (in number of pairs) and value of per capita purchase and consumption, and per 1000 numbers of households reporting consumption, during the reference period of 30 days for each state/u.t. (Appendix B) and India (Appendix A). Three categories of footwear are considered: leather boots/shoes, "leather sandals/chappals" and "rubber/PVC footwear". Together these categories account, in both rural and urban sectors, for nearly 80% of the value of consumption of footwear. The 43rd round all-India estimates are shown after the corresponding 50th round estimates. Value of per capita consumption of footwear in India during a period of 30 days was estimated by the 50th round survey as about Rs.2.50 in rural areas and about Rs.4.20 in urban areas (NSS report nos.401, 402). However, Table 2 shows no significant difference in number of pairs purchased or used per person between rural and urban sectors. Urban per capita consumption levels and percentage of population reporting consumption are higher than rural levels for "leather boots/shoes" and lower for "rubber/PVC footwear". This is similar to the results of the 43rd round.

4.2.5 Percentages of households reporting consumption show a marginal decline since the 43rd round in both sectors, uniformly for all three categories of footwear considered here. The demand for leather chappals/sandals in urban areas, and for leather boots/shoes in rural areas, in particular, appear to be declining.

4.2.6 The states/u.t.'s, as usual, exhibited considerable variation in the quantity and value of per capita purchase and consumption and the percentages of households reporting consumption of footwear. In particular, the states of Jammu & Kashmir, Haryana, Punjab, Himachal Pradesh, Rajasthan and Kerala had per capita consumption levels considerably above the all-India average.

4.2.7 Cash purchase and total consumption Clothing may be available for consumption to a household through purchase, home production, or receipt of gifts of clothing. As per capita consumption of clothing out of home-produced stock is found to be negligible at state and all-India level (and as net receipts of gifts of clothing, which may be quite significant for individual households, would be close to zero for a state/u.t. as a whole), it might be expected that estimates of per capita purchase and per capita consumption would coincide for any state/u.t. However, there appears to be a tendency for estimates of purchase to exceed estimates of consumption for important clothing items such as "sari" and "cloth for shirt,...etc.” uniformly for rural and urban
areas. Some reporting bias is apparently at work here. A likely explanation of the bias appears to be that informants find it more difficult to recollect consumption during the reference month of clothing purchased before the start of the reference month, and relatively easier to report purchases during the month of clothing yet to be consumed.

3. MEDICAL, EDUCATIONAL, RENT, CONVEYANCE AND OTHER MISCELLANEOUS EXPENDITURE

4.3.1 Non-food consumer expenditure is usually divided into six to eight different heads for the purpose of presentation of NSS estimates, such as clothing, fuel and light, and durable goods. Of these, the category "miscellaneous goods and services" commands the largest share of expenditure in both rural and urban areas. Monthly per capita expenditure on this group of items was, according to the present survey, Rs.49 out of a total non-food expenditure of Rs.103 in rural areas, and Rs.126 out of Rs.208 for urban areas. Further, the share of this group has been increasing over time: in rural areas, it has doubled over the period 1972-73 to 1993-94 (27th round to 50th round of NSS). Unfortunately, most items of the "miscellaneous" category, in particular the consumer services, are not amenable to measurement of quantities consumed. This makes it extremely difficult to separate out changes in level of physical consumption from changes in prices - as can be done to a reasonable extent for food and clothing - and make meaningful comparisons over time of such data.

4.3.2 Miscellaneous goods and services are defined as a residual category containing items other than food, pan, tobacco, intoxicants, fuel, clothing, footwear and durable goods. The "miscellaneous" category thus includes medical and educational expenses, rent, conveyance, other consumer services, toilet articles, and other non-durable household articles. Some petty durables such as spectacles, torches and locks are included among miscellaneous goods and services by convention.

4.3.3 Table 6 (R & U) gives the break-up of monthly per capita expenditure on miscellaneous goods and services by a number of sub-groups following the layout of the household consumer expenditure schedule: amusement, goods for personal care and effect, toilet articles, sundry articles, conveyance, rent, consumer taxes and cesses, educational expenses, medical expenses, and (other) consumer services. The coverage of each of these sub-groups has been explained in Chapter 3. This break-up is given for each of 12 MPCE classes of population in rural and urban areas of the 15 major states.

4.3.4 It is seen (Table T7) that urban households spent nearly five times as much per person on education and three times as much per person on conveyance as rural households. Per capita expenditure on rent was Rs.19 (about 4% of total MPCE) in urban areas and only Re.1 in rural areas. The proportion of MPCE accounted by medical expenses appears to be a little higher in the rural sector than in the urban. Also, the importance of medical expenditure relative to the other miscellaneous heads (education, conveyance, other consumer services, etc.) is seen to be appreciably greater in rural areas compared to urban areas.

4.3.5 Medical expenses are further sub-divided in Table 6 into those expenses incurred as an in-patient of a hospital/nursing home/other medical institution and other expenses (called "institutional" and "non-institutional" medical expenses respectively). While institutional medical expenses, at the all-India level, accounted for more than a fourth of all medical expenses in urban areas, the share of institutional expenses was less in rural areas (about one-sixth of the total).

4.3.6 Inter-state differences in per capita spending on the different heads of miscellaneous expenditure were more pronounced in rural areas than urban. For instance, educational expenditure per person in rural areas was as high as Rs.9-10 per month in Punjab, Kerala and Haryana, around Rs.4-6 in West Bengal, Uttar Pradesh and Tamil Nadu, and less than Rs.3 in all other major states. In urban areas, the figures for 12 of the 15 major states were between Rs.12 and Rs.18. For the remaining three - Haryana, West Bengal and Punjab - they were above Rs.24.

4.3.7 Per capita expenditure on conveyance, varied between Rs.12 and Rs.29 for the urban areas of major states. In rural areas, it was as low as Rs.2-3 in Orissa and Bihar, and about Rs.3-4 in West Bengal, Madhya Pradesh and Assam, but as high as Rs.15-16 in Punjab and Kerala.

4.3.8 Medical expenditure per person in urban areas varied between Rs.15 and Rs.25 for 11 of the 15 major states, though it was as high as Rs.34 in Punjab and only Rs.10-11 in Bihar and Assam. In rural areas it varied from under Rs.5 in Bihar to over Rs.29 in Punjab.
4.3.9 In the urban sector, Tamil Nadu reported about 40% of medical expenditure as institutional medical expenses. For urban Maharashtra and Kerala, the share of institutional expenditure was about one-third. In these three states, and in Punjab, per capita institutional medical expenses in urban areas exceeded Rs.8 per month (a level equivalent to an annual figure of about Rs.100). In all other major states, the reported per capita institutional medical expenditure in urban areas was less than the all-India average of about Rs.5.50. In rural areas, only Punjab and Kerala reported per capita expenditure of more than Rs.5.

4.3.10 There was very little inter-state variation in per capita expenditure on toilet articles, especially in the urban sector.

4.3.11 Monthly per capita expenditure exceeding Rs.20 on rent was reported by urban areas of Karnataka (Rs.28), Tamil Nadu and Andhra Pradesh (Rs.27), Haryana (Rs.23), and Assam (Rs.22). All other major states except Kerala (Rs.9) reported rent expenditure to be between Rs.10 and Rs.19. In rural areas of all states except Tamil Nadu, less than Rs.2 was spent per person per month on rent.

Detailed miscellaneous items

4.3.12 The "miscellaneous goods and services" category is split up into 94 detailed items in the household consumer expenditure schedule to help reduce recall error. Leaving out educational and medical expenses, which will be taken up later, there are 74 miscellaneous items. Very few of these items contribute more than Rs.0.50 to total MPCE in the rural sector or Rs.1.00 in the urban sector. Some of the relatively important ones are shown in Table 4 which gives per capita expenditure in cash and kind by state/u.t and sector, as well as per 1000 numbers of households reporting consumption, for each of the 14 selected miscellaneous items. The items include toilet soap and four other toilet items, washing soap, bus and railway fare, and expenditure on postage, telegram and telephone. One or two items such as petrol and railway fare have been included in view of their importance in the context of economic development rather
than their relative weight in total miscellaneous expenditure, or the prevalence of their use in this country.

4.3.13 A comparison of the 43rd and 50th round all-India figures of Table 4 helps to identify the important items on which per capita expenditure has increased faster than average MPCE between 1987-88 and 1993-94. The "per 1000 reporting" column is useful in identifying upward and downward trends in prevalence of consumption.

4.3.14 It may be mentioned here that the increase in average MPCE between the 43rd and 50th rounds was (as calculated from estimates appearing in NSS report no.402) about 78% in the rural sector and about 83% in the urban sector. Viewed against this, the most significant increase revealed by Table 4 is found to be in case of postage, telegram and telephone charges in the urban sector (a six-fold increase). It appears likely that the telephone charges component (which is not available separately for the 43rd round) has increased severalfold in urban India over this period. Per capita expenditure on petrol has risen to 3-4 times its value in the 43rd round; for urban India it is estimated at Rs.7.35 per month in the 50th round. Increases in toilet soap and washing soap expenditure have kept pace with increase in overall MPCE. While per capita bus fare expenses have risen slightly faster than MPCE, with the urban estimate for the 50th round standing at Rs.7.97 compared to Rs.4.73 for rural; railway fare expenses have risen rather slowly and have hardly increased at all in the rural sector. Finally, cinema/theatre expenditure per person has risen by less than 25% in rural India in the 6-year period between the 43rd and 50th rounds and has actually fallen in urban India from Rs.1.64 to Rs.1.55 per month, the proportion of urban households reporting such expenditure "last month" has dropped from 465 to 300 per 1000. There is little doubt that the latter figure reflects the remarkable inroads made by television into urban life in India in the last decade.

4.3.15 Per capita expenditure by state/u.t. and sector on books/journals, newspapers/periodicals, tuition fees, doctor's fees, and medicine (institutional and non-institutional separately) are shown in Table 5, with the all-India figures for the 43rd round shown at the end.

4.3.16 The most significant increase in expenditure between the 43rd and 50th rounds is that on tuition fees (school/college) in the urban sector, which has nearly tripled from Rs.2.84 to Rs.8.12 per person per month. Per capita expenditure on medicines has more than doubled in both rural and urban India during this period (1987-88 to 1993-94). The estimated proportions of rural and urban households in India reporting expenditure on medicine during the last 30 days are quite close to each other (around 50-55% in the 50th round), and this is true for most of the major states as well.

Chapter 5

Consumption level and pattern of different fractile groups

5.0 One way of studying disparities in consumption is to generate separate sets of consumption estimates for different fractile groups (see para 3.23) of population. At the all-India level this has already been attempted (see NSS report no. 402) by using approximate fractiles of the all-India MPCE distribution as class limits for generation of tables by MPCE class. For state-level fractile group studies, one needs to form fractile groups separately for different states. The results for the major states are discussed in this chapter.

5.1 Differences in consumption pattern of poorer and richer segments of population (ranked by MPCE) can be very conveniently studied from Table 8 (R&U). For each of the 15 major states, this table gives the item-groupwise break-up of average MPCE for twelve fractile groups or classes of MPCE starting from the bottom 5% and ending with the top 5%. This makes it easy to study differences in consumption pattern between such groups as, say, the top 5% and the middle 20% of the population of any state, or among the poorest 10% in different states. Measures of inequality in consumption and specific concentration curves can be quickly constructed from these tables.
5.2 Table 7 (R&U) gives information regarding sample and population sizes of the different population fractile groups in major states, and some details of household composition in terms of per household numbers of males and females, adults and children, and consumer units.

5.3 In the rural sector, the average MPCE of the bottom 5% is seen to be around Rs.85-95 in Maharashtra, Orissa, Madhya Pradesh, Bihar and Tamil Nadu, around Rs.120-135 in West Bengal, Rajasthan, Haryana, Kerala and Assam, and over Rs.160 in Punjab. At the all-India level, average MPCE of the bottom 5% was Rs.101.

5.4 In the urban sector, average MPCE of the bottom 5% was Rs.133 for the country as a whole. For 8 of the 15 major states, the figure was within Rs.120-135. It was Rs.187 in Punjab, Rs.176 in Assam and around Rs.160 or more in Haryana and Gujarat.

Fig 3: Consumption pattern of lowest and highest spending brackets

Fig 4: Average MPCE (Rs.) of bottom 5% of population of major states

5.5 Average monthly spending levels of the top 5% of the population varied considerably in the rural sector. From only a little over Rs.500-Rs.600 for Assam, Bihar and Orissa, the figures are seen to rise to Rs.1300 for Punjab, Haryana and Kerala - incidentally, the three states with highest average rural MPCE for the whole population. Tamil Nadu (Rs.1050) and Andhra Pradesh (Rs.946) held the next two positions in this respect. For India as a whole, average MPCE of the top 5% of the population was Rs.875.
5.6 In the urban sector there was less inter-state variation in average spending of the top 5%. For 9 of the 15 major states, this average was between Rs.1200 and Rs.1520. Average MPCE of the top 5% of the all-India population was Rs.1626. Note that all the major states will not necessarily be represented in the top (or bottom) 5% population of the country as a whole ranked by spending levels.
Chapter 6

Alternative estimates of expenditure with month and year as reference periods

6.0 Estimates of consumer expenditure presented so far were based on a reference period of "last 30 days". However, a larger reference period of "last 365 days" has certain advantages for some items of consumption such as clothing, footwear, durables, education, and medical goods and services on which expenditure is, typically, "lumpy" - not spread evenly over different months of a year. The quinquennial consumer expenditure surveys, therefore, collect data on such items for two different reference periods - "last 30 days" and "last 365 days". Using the expenditure figures for these item groups, based on the longer reference period one obtains a different value of MPCE which is here termed as "adjusted MPCE". Changes in averages and distributions of MPCE as a result of this adjustment are naturally of primary interest.

6.1 The categories of goods and services for which data for the last 365 days were collected in the 50th round - namely, clothing, footwear, educational and medical (institutional) goods and services, and durable goods - will be referred to in what follows as “Group B items”.

Movement to higher/lower MPCE classes when “year” data are used

6.2 The MPCE of household can change as a result of adjustment. The change may be large enough to cause the household to move to a different MPCE class. Changes of this kind will affect the estimated distribution of MPCE.

6.3 Table T8 shows the essential features of inter-class movements as a result of MPCE adjustment, separately for rural and urban India.

6.4 The most noticeable feature of Table T8 is that “+1” movements (one class up) are more common than “-1” movements (one class down). The “+1” column figure exceeds the “-1” column figure for all classes except the top three for the rural sector. For the highest MPCE class, of course, there can be no upward movement.

6.5 “+2” movements are more frequent than “-2” movements for the first seven classes in the rural sector (starting from the lowest) and for the first six classes in the urban sector. Quite obviously, if class widths did not increase progressively, as they do, as one moves up the MPCE range, but remained the same, this feature would be noticed for a few more classes.
6.6 Very clearly, therefore, the data indicate that average MPCE goes up as a result of adjustment using “year” data in place of “month” data for the majority of households in all but a small part of the MPCE range (the top part), in both rural and urban sectors.

6.7 The table is, of course, restricted in its expository power by the fact that it reveals nothing about the direction of “0” (that is, within-class) movements. But the frequencies of non-“0” movements are themselves revealing.

6.8 By definition, unadjusted and adjusted MPCE, for a household, differ simply by the extent by which “reference month” expenditure (say, \( E_m \)) on Group B items differs from one-twelfth (approximately) of 12-month expenditure \( E_y \) on the same items. Table T8, therefore, reveals that
in a substantial part of the MPCE range, households for which $E_y$ exceeds 12 times $E_m$ outnumber households for which $E_y < 12E_m$.

6.9 This suggests that the large, lumpy expenditures of households on Group B items typically take place in only a few months of the year (1,2,3 or 4 months perhaps), while in the remaining months a “base level” MPCE prevails, composed of expenses which are incurred regularly every month. A household under these circumstances is more likely to be surveyed in a “base level MPCE” month than in one of the months in which large irregular or bulk expenditures take place. This means that most sample households will be reporting their “base level MPCE” as “MPCE last month”. Their 12-month figure $E_y$ will consequently exceed 12 times $E_m$, implying that adjusted MPCE will exceed unadjusted MPCE.

6.10 This, as was said, will happen for a majority of households. The remaining households will be surveyed in (or for) months in which they have incurred large expenditures on Group B items. For them, $E_m$ will be greater than one-twelfth of $E_y$, and hence “MPCE last month” will exceed adjusted MPCE. In fact, the big expenditures incurred by them last month will considerably raise their (unadjusted) MPCE level. This is what Table T8 shows when it records “minus” movements as predominant in the top MPCE classes. It is in fact the method of computation of household MPCE (adding up all normal and abnormal consumption expenditure last month) which automatically places most of the “12.$E_m > E_y$” households in the upper (unadjusted) MPCE classes.

**Differences in the distributions of MPCE using “monthly” and “yearly” data**

6.11 It is interesting to compare distributions of “adjusted” MPCE - built up using 365 days’ consumption data for these items - with the "unadjusted" (30 days' data based) MPCE distributions.

6.12 Table 9 (R&U) presents these distributions for rural and urban sectors of each state (col.16 gives number of households in each MPCE class based on unadjusted MPCE data, while the last but one row gives the corresponding figures using adjusted MPCE data). The table also gives for each MPCE class the per 1000 distribution of households in the class prior to adjustment of MPCE, over MPCE classes after adjustment of MPCE.

6.13 Table T9 shows the all-India distributions of MPCE - rural and urban - before and after adjustment using “year” data. It may be observed that for rural and urban distributions the effect of adjustment is to increase the proportion of households in the middle of the MPCE range (roughly, Rs.190-455 for rural, Rs.265-825 for urban) at the expense of the segments outside this range. The adjusted distribution is thus less dispersed than the unadjusted. This is understandable as a
particular month's consumption may be abnormally high or low; annual consumption figures can be expected to be less fluctuating.
Table T9: All-India MPCE distributions before and after adjustment using "yearly" data

**Notes:**
- NSS 50th Round: 1993-94
- Data includes expenditure on items of educational, medical and miscellaneous goods & services per person for a period of 30 days.
- Monthly per capita expenditure class (Rs) ranges from less than 120 to 560 or more.
- Haryana reporting consumption includes the number of sample households and sample size for each category.

</table>

**Table notes:**
- All items are listed for each monthly per capita expenditure class (Rs) from 120 to 560 or more.
- The table includes data for both rural and urban areas.
- The columns represent various categories of expenditures such as amusement, goods personal care, toilet articles, etc., along with their respective expenditure details.
- The table also includes the number of sample villages for each category.

**Punjab**
- Number of sample villages: 205
- Total expenditure for all items: 16.95 24.24 23.76 25.21 31.85 33.38 41.97 44.58 59.86 74.86 106.14 211.88 49.01 998 2041

**Rajasthan**
- Number of sample villages: 312
- Total expenditure for all items: 14.16 15.87 20.55 22.48 24.93 28.09 31.51 37.47 43.85 61.79 87.51 260.66 54.06 998 3093

### Note
- The table shows the distribution of households, persons, and consumer units per 1000 households for each fractile group in Andhra Pradesh, Assam, and Bihar.
- The data includes the number of adult males, adult females, children, total persons, and total consumer units per 1000 households.
- The number of sample blocks for each state is also mentioned.

**Note:**
- The table data represents the distribution of various demographic and economic indicators per 1000 households for different fractile groups in urban, Haryana, and Karnataka regions.
- For each region, the table shows the distribution of households, persons, and consumer units, along with the number of adult males, adult females, children, total persons, and total consumer units per 1000 households.
- The data is divided into different fractile groups, with each group having specific values for each demographic category.
- The table includes estimated numbers and sample sizes for each region and fractile group.

Note: "No. of sample blocks" refers to the number of sample blocks used in the survey for each state. The table shows the distribution of households, persons, and consumer units per 1000 households for different fractile groups in Tamil Nadu, Uttar Pradesh, and West Bengal. The data includes the number of adult males, adult females, children, total persons, and total consumer units for each category.
